

ABSTRACT

There is provided a switch unit with quite operation.

A switch shaft connection shaft 24 is formed on a switch
5 knob 22, and connected to a switch shaft 26. Therefore, the
switch shaft 26 can move in response to an inclination
restoration operation of the switch knob 22. Further, the
switch shaft 26 has movement in the lateral direction
regulated by a guide rail 17, which makes it possible to
10 always exert pressing force vertically with respect to a tact
switch 25. Moreover, a region where the tact switch 25 is
pressed from the switch shaft 26 is constituted by a resilient
member, which means that there is no striking noise when the
switch shaft 26 strikes the tact switch 25, and it is possible
15 to provide a switch unit that is quiet at the time of
operation.
